The number of illegitimate births registered during the year was 2,651, being 275 more than for 1929. This gives a rate of 37.2 per 1,000 living births, or 3.72 per cent. The rate continues to increase and this Province shares with Manitoba the highest illegitimacy rate in the Dominion.

The table following shows how steady has been the increase especially since 1918. Two peaks are indicated: beginning with the low rate of 12.5 in 1905 there is a rise to 1914 (22.1), then a decline to 1918 (18.2), then a steady rise to the present highest point of 37.2 which is almost three times the rate of 1905.

The number of still births registered as births during the last twenty years is shown above. It will be noted at once that the rates of still-born children to total births has almost doubled in this period and while it is true that it represents between three and four per cent. of all births, nothing is being done in a large way to ascertain the causes of still births. These figures represent only children who had reached "viable age," that is to say, about seven months. How many more children were born prematurely before this period it is impossible to say as it is not considered necessary to register a premature birth as a birth or as a death, which has not reached this age. The saving of these children, if that were possible, would add to the assets of the Province.

PLURAL BIRTHS

There were 839 cases of twins of which 885 were males and 793 females. Of six cases of triplets, 10 were males and eight females.

(See Table 12 for a classification of these.)

BIRTHS BY AGES OF PARENTS

(See Table 7, page 12.)

It may be interesting to note that there were six children born to married mothers under 15 years of age and five to unmarried mothers under 14 years. There were two children born to mothers over 50 years of age and 56 children to fathers over 65 years of age.

In the above table it will be noted that organic diseases of the heart which has held first place as a cause of death for many years still maintains it. There is a decrease in number and in rate, the first decrease since 1924 and whereas the decrease in 1924 was 7.5 in the rate, the decrease between 1929 and 1930 is 10.0 per 100,000 of population.

Deaths from pneumonia, influenza and tuberculosis show the lowest rates in the decade.

This is true also for deaths from apoplexy. It is possible, however, that the low rate is in some measure due to diagnoses attributing a larger number of deaths to diseases of the arteries. This cause shows the highest rate ever reached.

Deaths from external causes continues to increase its rate by a little better than 1 per cent. per annum, i.e., the rate in 1930 is 12.4 per cent. higher than that of 1920.

The rate of deaths from Bright's disease has increased 15.7 per cent. in the decade.

The following Table is appended to allow a comparison in respect to births classified according to place of occurrence and place of residence. In the first column appears the number of deaths which took place in the various counties followed by the rate per 1,000 population and the third column shows the number of deaths of residents of the county having regard to residence only and not to the place of death, so that where the third column contains a larger number than the first column it shows that a number of the residents died in some other county and where the number in the first column is greater than in the third, the difference would indicate a balance of non-residents.

The above tables indicate a slight increase in the number of deaths of children under one year of age, with a decrease in the rate of 7.9 per 1,000 living births. This is the greatest decrease since 1924 when the rate dropped 9.1 and it is not the lowest rate by 2.8, the lowest rate being 71.1 reached in 1927.

The chief causes remain unaltered. For a further analysis of causes of death of children under one year, see Tables 26 and 27.

As to ages, *i.e.*, by days, weeks, months, see Table 23. It will be noted that about 20 per cent. of all children who die under one year of age die before they have completed one full day. Over 39 per cent. do not live to complete one full week and over 52 per cent. do not complete one month.

The death rate since 1901 when it was 120.0 per 1,000 living births has declined to 73.9 at which it stands to-day.

In other words over 7 per cent. of all babies born alive die under one year and of those who die in the first year of life, one-fifth die before they are 24 hours old, one-third before they are one week old, one-half before they are a month old.

In the above table will be noted the increase in the number of deaths from falls, the highest rate ever reached; over 14 per cent. of all accidental deaths were from falls. Automobiles, while claiming 49 fewer lives, accounted for 21.8 per cent. of accidental deaths and drowning took 14.39 per cent., and 30.3 per cent. were accounted for by many other types of accidents.
